Light OS for Hyper-V

I'm running the Ubuntu 20.4, but I was wondering if there was a lighter os than that to run on Windows 10's Hyper-V because i am low on ram. I need a vm so I can have a video call easily.

I personally like **arch**. it **consumes less than or around 500MB of ram** while idling with mpv playing a looped vp8 webm with sway compositor. and a few background services...

it would probably consume less if running headless and vanilla.

and of course you have specialist distros like **puppy linux** and **Damn Small Linux**.

Are arch/puppy easy to setup like Ubuntu?

Arch is not the easiest, but IMO is the most rewarding.

Damn small linux, and puppy linux will probably be your go tos.

There are several options. It depends on what you are expecting.

Of course, you could go **Tiny Core** as it literally requires almost no RAM. The recommended RAM is 128 MB, but the minimum is 64MB. **The only problem is that it isn't for an average user.** If you're willing to spend your time setting up extra tools, then you can easily go for it. Otherwise, you should check other options.
